

Question 1: What is a conditional statement in programming?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 2: What does an if statement do?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 3: What is the purpose of an else block?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 4: When is an else block executed?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 5: What is a Boolean expression?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 6: Write the syntax of a simple if statement.

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 7: What operator is commonly used to test equality?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 8: What does the modulus (%) operator return?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 9: How can you check if a number is even?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow

programs to respond differently to different situations.

Question 10: How can you check if a number is odd?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 11: What is the purpose of else-if?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 12: What is a nested if statement?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 13: Can an if statement exist without an else?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 14: What is the output when a false condition is tested in an if statement without else?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 15: What is the role of braces {} in C/C++ conditionals?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 16: What does > mean?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 17: What does < mean?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 18: What does `>=` mean?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 19: What does `<=` mean?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 20: What does `!=` mean?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 21: What is a switch statement?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 22: What is a case label in a switch statement?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 23: Why is break used in switch?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 24: What happens if break is omitted?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 25: What is the default case in switch?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 26: Can switch compare strings in C++?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow

programs to respond differently to different situations.

Question 27: Which statement is better for many constant choices: if-else or switch?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 28: How do you test whether a value is positive?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 29: How do you test whether a value is negative?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 30: How do you test whether a value is zero?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 31: Write a condition to check if age is at least 18.

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 32: Write a condition to check if marks are above 50.

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 33: What is decision making in programming?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 34: Can nested if statements have multiple levels?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 35: What is logical AND (&)?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 36: What is logical OR (||)?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 37: What is logical NOT (!)?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 38: How do you check if a year is divisible by 4?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 39: What is a leap year?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 40: What is the first condition for a leap year?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 41: How do you find the largest of two numbers?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 42: How do you find the largest of three numbers?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 43: What is an if-else-if ladder?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow

programs to respond differently to different situations.

Question 44: What is the difference between if and switch?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 45: Can switch use ranges directly?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 46: What is fall-through in switch?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 47: What data type is usually used for conditions?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 48: Why are conditional statements important?

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 49: Give one real-life example of a conditional statement.

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.

Question 50: Name four conditional structures covered.

Answer: Conditional statements help control program execution by checking conditions and performing actions accordingly. They improve decision-making, logic implementation, and allow programs to respond differently to different situations.
